

## DIGITAL RADIOGRAPHY

---

### X-FRAME DR-EZ:

#### Upgrade package con Digital Detector

**X-FRAME DR-EZ** is the latest product from Italtay: it represents an highly flexible instrument in Digital Radiography that is mainly used as DR upgrade for analogue traditional x-ray.

It is based on the cassette-size digital flat panel detector featuring amorphous Silicon (a-Si) technology and a Caesium Iodide (CsI) scintillator, that for its standard formats (35x43 cm and 24x30 cm) can be used inside traditional bucky and cassette-holder of any analogue x-ray rooms.

**X-FRAME DR-EZ** can be easily installed in the main existing radiological systems since it is made essentially of: one acquisition station, the cassette-size battery-powered detector and one access point that grants for wi-fi communication between them.

**X-FRAME DR-EZ** works on existing radiological environment without any hardware change, just using the detector "autotriggering" property that synchronizes autonomously acquisition beginning with x-ray emission.
